Medicine Supply Alert Notice

Phenytoin sodium NRIM 100mg capsules

Priority:  Level 3’ - update to MSAN (2020)1
Valid until:  to be confirmed

Issue
1. Due to a regulatory change at their manufacturing site, Accord are out of stock of phenytoin sodium 100mg capsules with no confirmed resupply date.
2. Phenytoin is classified by the Medicines and Healthcare products Regulatory Agency (MHRA) as a Category 1 anti-epileptic drug; for these drugs, prescribers are advised to ensure that their patient is maintained on a specific manufacturer’s product.
3. An alternative phenytoin sodium 100mg capsules manufactured by Flynn Pharma is available, however switching to an alternative formulation requires monitoring and may also require specialist support, advice or referral. The brand should be clearly stated on the prescription.
4. Prescribers should make early contact with patients or their parent/carer to determine the brand of phenytoin 100mg capsules the patient is taking, and actions taken as detailed below where they are being prescribed phenytoin manufactured by Accord.
5. Prescribers should read the latest MHRA guidance (see Annex A) and ensure that patients are maintained on the same manufacturers brand of phenytoin preparation going forward and that the brand is clearly stated on the prescription.

Advice and Actions
6. Healthcare professionals in primary care who prescribe and dispense phenytoin 100mg capsules, manufactured by Accord should take the following actions:
   i. switch patients to phenytoin sodium 100mg capsules manufactured by Flynn Pharma, where clinically appropriate and follow advice set out in Annex A.
   ii. if phenytoin sodium 100mg capsules manufactured by Flynn Pharma are not clinically appropriate then alternative phenytoin formulations should be considered.
   iii. prescribers and pharmacists should work together to understand which formulations are available and ensure the patient receives the correct dose of any alternative product. They should work together to ensure monitoring requirements are undertaken as set out in Annex A.
   iv. prescribers should make early contact with secondary care or tertiary care specialists if specialist support is required for specific patients and ensure that any patient whose epilepsy is unstable is referred to specialist care for management.

Additional Information
7. Phenytoin sodium 100mg capsules are licensed for the control of tonic-clonic seizures, partial seizures or a combination of these, and for the prevention and treatment of seizures occurring during or following neurosurgery and/or severe head injury. It has also been employed in the treatment of trigeminal neuralgia as second line therapy if carbamazepine is ineffective or

patients are intolerant to carbamazepine. Dosage is individualised as there may be wide interpatient variability in phenytoin serum levels with equivalent dosage. In some cases, serum level determinations may be necessary for optimal dosage adjustments.

Enquiries
8. Any enquiries should be directed to PharmacyTeam@gov.scot.
Phenytoin sodium NRIM 100mg capsules

Advice on switching patients and dose equivalence

1. Switching to alternative phenytoin sodium 100mg capsule preparation
   - It is recommended that patients who require switching should be prescribed an alternative manufacturers' phenytoin sodium 100mg capsule in the first instance. Phenytoin 100mg capsules are available from Flynn Pharma and therefore, prescribers should prescribe ‘Phenytoin sodium 100mg capsules (Flynn Pharma Ltd)’, where clinically appropriate.
   - When switching a patient from phenytoin sodium 100mg capsules manufactured by Accord to phenytoin 100mg capsules manufactured by Flynn Pharma, no initial dosing adjustments are required. Both preparations contain phenytoin sodium.
   - As this is a Category 1 anti-epileptic drug, patients should be monitored closely during the switching period (see monitoring section).

2. Switching to alternative formulations
   - For patients considered not suitable for this switch to the Flynn Pharma capsules, there are a number of alternative licensed phenytoin preparations available.
   - For such patients, it is important to note that doses of sodium salt preparations (capsules, tablets, injection) require dose conversion when switching formulations from and to phenytoin base preparations (suspension and Infatabs).
   - Although 100mg of phenytoin sodium is equivalent to 92mg of phenytoin base on a molecular weight basis, these molecular equivalents are not necessarily biologically equivalent. Thus, care should be taken where it is necessary to change the dosage form
   - In practice, the conversion used is, phenytoin sodium 100mg is equivalent to phenytoin base 90mg therefore 100mg capsule is equivalent to 90mg suspension.
   - Prior to undertaking any formulation switch, prescribers should work in close collaboration with their pharmacists to understand which phenytoin formulations are available and ensure patients are monitored appropriate (see monitoring section).

Monitoring patients after switching

3. As different formulations and manufacturer’s products of phenytoin may not be bioequivalent, prescribers in primary care should ensure appropriate monitoring is carried out for all patients’ undergoing switches from their regular phenytoin product.

4. The following advice should be followed:
   - Patients should be monitored closely for toxic effects and changes in seizure frequency. Patients should be referred to a specialist for review if there are changes in seizure control or the product is not tolerated.
   - Monitoring of plasma trough levels of phenytoin should be carried out before a patient is switched and checked again two weeks after. The brand switch should not be deferred whilst awaiting the pre-switch result.
   - If the blood level has changed, the phenytoin dose should be adjusted (usually in 25 mg increments) and the blood level repeated every 3 weeks until the pre-change phenytoin plasma level is achieved.
Phenytoin Therapeutic Drug Monitoring services are routinely available but local neurology services should be contacted for assistance if required.

Patients should continue to have their routine checks for renal function and albumin level.
